MANAGEMENT OPTIONS FOR ENLARGED OVARIES DETECTED IN THE FIRST TRIMESTER OF PREGNANCY

This is an automatically generated default intro template - please do not edit.

Abstract:
Ovarian cysts have a reported incidence in pregnancy between 1:81 and 1:2500. The development of ultrasound in the first trimester has increased the concern for differential diagnosis of adnexal masses and ovarian cysts. The aim of the present study is to summarize the medical management options for enlarged ovaries detected in the first trimester of pregnancy. The treatment includes the ultrasound follow-up in the second trimester. Laparoscopy is an adequate approach for diagnosis and treatment. The exteriorization of the uterus in cesarean section is useful for diagnosis and treatment.

Keywords:
ovarian cyst, pregnancy, laparoscopy, ultrasonography, cesarean section

 MANAGEMENT OPTIONS FOR ENLARGED OVARIAN DETECTED IN THE FIRST TRIMESTER OF PREGNANCY

Ovarian cysts have a reported incidence in pregnancy between 1:81 and 1:2500. The development of ultrasound in the first trimester has increased detection rates and led to the management dilemma of ovarian cysts, particularly when they are large. The presence of complications, while exteriorizing the uterus in cesarean section is useful for diagnosis and treatment.
